

<b>Course Code</b> ECE-100	<b>Course Title</b> Electric Circuits I	<b>ECTS Credits</b> 6
<b>Department</b> Engineering	<b>Semester</b> Fall, Spring	<b>Prerequisites</b> None
<b>Type of Course</b> Required	<b>Field</b> Engineering	<b>Language of Instruction</b> English
<b>Level of Course</b> 1 <sup>st</sup> Cycle	<b>Year of Study</b> 1 <sup>st</sup>	<b>Lecturer(s)</b> Dr George Gregoriou
<b>Mode of Delivery</b> Face-to-face	<b>Work Placement</b> N/A	<b>Co-requisites</b> MATH-190

### **Objectives of the Course:**

The main objectives of the course are to:

- Provide the student with the fundamental knowledge of basic electrical concepts that will form a major part of the foundation required to analyze the most complex electrical and electronic systems.
- Develop a thorough understanding of the fundamental concepts of dc circuit analysis and their application to real-world problems.
- Develop an overall understanding of electrical laws and rules, methods of analysis, and network theorems, introduced via resistive, inductive, and capacitive dc circuits.
- Introduce the terminal behavior of the Transistor and the Operational Amplifier, so that they can be confidently used in practical designs.
- Arouse interest in further work and research in the area of electrical/ electronic engineering.

### **Learning Outcomes:**

After completion of the course students are expected to be able to:

- Use electrical rules and laws to calculate the voltage across and the current through each component of a dc circuit.
- Compare and apply the methods of circuit analysis, and network theorems.
- Analyze the terminal behavior of the Transistor and the Operational Amplifier and incorporate them in practical designs.
- Identify the physical principles, which explain the operation of inductors and capacitors and their effect on RL and RC circuits.
- Explain the natural and step response of RL and RC networks and analyze the behaviour of switching circuits.

### **Course Contents:**

- Basic electrical concepts (current, voltage, resistance, power, energy, efficiency).

- Electrical laws and rules (Ohm's law, Kirchhoff's laws, VDR, CDR).
- The dc levels of a transistor network, dependent sources.
- The Operational Amplifier.
- Methods of analysis (d.c.) such as Mesh analysis, and Nodal analysis.
- Source Transformations.
- Network Theorems such as Superposition theorem, Thevenin's theorem and maximum power transfer, Norton's theorem.
- Inductance and Capacitance.
- The natural and step responses of RL and RC circuits. Switching circuits.

**Learning Activities and Teaching Methods:**

Lectures, in-class design examples.

**Assessment Methods:**

Homework, exams, final exam.

**Required Textbooks/Reading:**

<b>Authors</b>	<b>Title</b>	<b>Publisher</b>	<b>Year</b>	<b>ISBN</b>
James W. Nilson, Susan A. Riedel	Electric Circuits	Prentice Hall	2008	0131989251

**Recommended Textbooks/Reading:**

<b>Authors</b>	<b>Title</b>	<b>Publisher</b>	<b>Year</b>	<b>ISBN</b>
Robert L. Boylestad	Introductory Circuit Analysis	Prentice Hall	2007	0131988263
David J. Irwin, Mark R. Nelms	Basic Engineering Circuits Analysis	Wiley	2008	9780470128695
